

Functional safety manual

Liquiphant M/S with electronic insert FEL54

Level Limit Measuring System

Application

Dry running protection or operating minimum detection of all types of liquids in tanks to satisfy particular safety systems requirements to IEC 61508/IEC 61511-1.

The measuring device fulfils the requirements concerning

- Safety functions up to SIL 2
- Explosion protection by flameproof enclosure
- EMC to EN 61326 and NAMUR Recommendation NE 21.

Your benefits

- \blacksquare For protection against dry running up to SIL 2
 - Independently assessed (Functional Assessment) by exida.com to IEC 61508/IEC 61511-1
- Monitoring for corrosion on the tuning fork of the sensor
- No calibration
- Protected against outside vibration
- Easy commissioning

Introduction

Note!

For general information about SIL please refer to: www.endress.com/sil

General depiction of a safety system (protection function)

Parameter tables for determining Safety Integrity Level (SIL)

The following tables are used to define

- The reachable SIL
- The requirements pertaining to the "Average Probability of Dangerous Failure on Demand" (PFD_{avg})
- The "Hardware Fault Tolerance" (HFT)
- The "Safe Failure Fraction" (SFF)

of a measuring system suitable for the safety function.

The specific values for the Liquiphant M/S measuring system with FEL54 (relay version) can be found in the Appendix.

Permitted probabilities of dangerous failures on demand of the complete safety related system dependent on the SIL (e.g. falling below a defined MIN level/switch point, that is the fork swings free) (Source: IEC 61508, Part 1):

| SIL | PFD _{avg} |
|-----|---------------------------------------|
| 4 | $\geq 10^{-5} < 10^{-4}$ |
| 3 | ≥ 10 ⁻⁴ < 10 ⁻³ |
| 2 | $\geq 10^{-3} \dots < 10^{-2}$ |
| 1 | ≥ 10 ⁻² < 10 ⁻¹ |

The following table shows the achievable Safety Integrity Level (SIL) as a function of the probability fraction of safety-oriented failures and the "hardware fault tolerance" of the complete safety system for type B systems (complex components, not all faults are known or can be described).

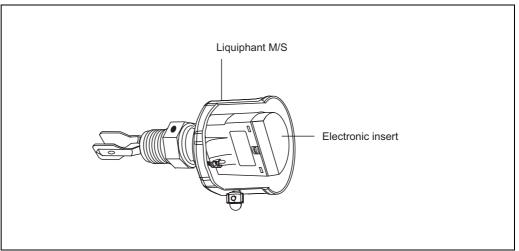

| SFF | | HFT | |
|------------|-------------|---------|--------------------|
| | 0 | 1 (0)1) | 2 (1) ¹ |
| < 60 % | not allowed | SIL 1 | SIL 2 |
| 60 %< 90 % | SIL 1 | SIL 2 | SIL 3 |
| 90%<99% | SIL 2 | SIL 3 | |
| ≥ 99 % | SIL 3 | | |

- In accordance with IEC 61511-1 (FDIS) (Section 11.4.4), the HFT can be reduced by one (values in brackets) if the devices used fulfil the following conditions:
 - The device is proven in use,
 - Only process–relevant parameters can be changed at the device (e.g. measuring range, \dots),
 - Changing the process–relevant parameters is protected (e.g. password, jumper, \dots),
 - The safety function requires less than SIL 4.

Structure of the measuring system with Liquiphant M/S with FEL54

Level limit measuring system

The measuring system is displayed in the following diagram (example).

L00-FTLxxxxx-16-06-xx-en-000

Safety function

The safety function only applies to MIN safety (protection against dry running) and use of the relay NO contacts working simultaneously.

The following settings are permitted for the safety function:

| Instrument | Setting | As-delivered state |
|----------------|--|-----------------------------|
| Liquiphant M/S | Density switch setting: 0.5 Density switch setting: 0.7 | Density switch setting: 0.7 |
| | "MIN" safety | "MAX" safety |

The level relay always works in quiescent current safety; i.e. the relay releases when:

- Falling below the switch point (level below response height, fork free)
- A detected fault occurs
- The mains voltage fails

In addition to the level relay, a red LED indicates the following:

- Level alarm (fork free) red LED illuminated
- Corrosion alarm or detected electrical fault red LED flashes (1 Hz)

Permitted versions of the Liquiphant M/S with FEL54 for the safety function

The following combinations are permitted for the measuring system:

| Liquiphant M with FEL54 | Liquiphant S with FEL54 |
|---|---|
| FTL50-######4###* FTL51-######4###* FTL50H-######4###* FTL51H-######4###* FTL51C-########## | FTL70-#####4####* FTL71-######4####* |

Permitted instrument types (# = all instrument versions permitted); * 4 = FEL54

Safety function data

The **mandatory settings** and data for the safety function can be found in the Appendix (Page 9).

The measuring system reacts in ≤ 1.4 s.

Note!

MTTR is set at 8 hours.

Safety systems **without a self-locking function** must be monitored or set to an otherwise safe state after carrying out the safety function within MTTR.

Supplementary device documentation

The following must be available for the measuring system:

| | Technical Information | Operating Instructions |
|-------------------|---|---|
| Liquiphant M | Types FTL50, FTL51, | Types FTL50, FTL51: KA143F, KA220F |
| | FTL50H, FTL51H: TI328F | Types FTL50, FTL51: KA163F (with aluminium housing/separate terminal compartment) |
| | | Types FTL50H, FTL51H: KA144F, KA220F |
| | | Types FTL50H, FTL51H: KA164F (with aluminium housing/separate terminal compartment) |
| | Type FTL51C: | Type FTL51C: KA162F |
| | T1347F | Type FTL51C: KA165F (with aluminium housing/separate terminal compartment) |
| Liquiphant S | For all instrument types: | Types FTL70, FTL71: KA172F |
| | TI354F | Types FTL70, FTL71: KA173F (with aluminium housing/separate terminal compartment) |
| Relevant contents | Connection data, Installation instructions | Setting, configuration, remarks, function tests |

Settings and installation instructions

Installation instructions

Please refer to the Compact Instructions (KA) for information regarding the correct installation of Liquiphant M/S with FEL54.

Since the application conditions have an effect on the safety of the measurement, pay attention to the notes in the Technical Information (TI) and Compact Instructions (KA).

Refer to the following documentation for instructions on setting the instruments:

| Instrument | Setting description in documentation: |
|------------|--|
| * * | KA143F, KA163F, KA144F, KA164F, KA220F, KA162F, KA165F, KA172F, KA173F, * |

^{(*} type-dependent, see Table: Supplementary device documentation, Page 6)

Settings for Liquiphant M/S with FEL54:

- The **density switch setting** must be configured according to the density range of the medium.
- The setting of the **safety mode** has an effect on the function. The DIL switch must be set to MIN in a SIL application.

Caution!

Observe the following for FEL54: The operator must use suitable measures (e.g. current limiter, fuse) to ensure the relay contact characteristics are not exceeded:

- \blacksquare U ≤ 253 V AC 50/60 Hz , I \leq 6 A, P \leq 1500 VA at cos \geq 0.7 or
- $U \le 30 \text{ V DC}$, $I \le 6 \text{ A}$, $P \le 80 \text{ W}$

Caution

Changes to the settings at the electronic insert FEL54 after measuring system start-up can impair the protection function!

Response in operation and failure

The response in operation and failure is described in the following documentation:

| Instrument | Setting description in documentation: |
|---------------------------|--|
| Liquiphant M/S with FEL54 | KA143F, KA163F, KA144F, KA164F, KA220F, KA162F, KA165F, KA172F, KA173F, * |

(* type-dependent, see Table: Supplementary device documentation, Page 6)

Recurrent function tests of the measuring system

The operativeness of the minimum detection must be checked annually if the PFD_{avg} values given in the Appendix are used.

The check must be carried out in such a way that it is proven that the minimum detection functions perfectly in interaction with all components. This is guaranteed when the response height is lowered in an emptying process. If it is not practical to empty to the response height, suitable simulation of the level or of the physical measuring effect must be used to make the level sensor respond. If the operativeness of the level sensor/transmitter can be determined otherwise (exclusion of faults that impair function), the check can also be completed by simulating the corresponding output signal.

In the case of recurrent tests, each permitted setting must be checked, especially whether all the alarm switches are set to ON.

Caution!

Note the following points for the function test:

- Relay contact switching can be checked by using a hand multimeter at the terminals or by observing the dry running protection elements (e.g. horn, actuating element).
- $\,\blacksquare\,$ During the recurrent test, all existing relay contacts must be tested.
- As a positive test result, a free tuning fork must be detected and trigger the alarm for dry running protection.
- If free fork is not detected during the recurrent test, the monitored process must be set to a safe state by means of additional or other measures and/or kept in the safe state until the safety system is repaired.

Appendix

Specific values and wiring options for the measuring system Liquiphant M/S with FEL54

The tables show values and wiring options relevant to safety for the measuring system.

Note

Note the following points on the tables below:

 \blacksquare The PFD $_{avg}$ value applies to alarms with NO contacts. Using NC contacts instead of NO contacts requires further consideration.

Warning

For safety related use for MIN detection, the following application errors must be excluded:

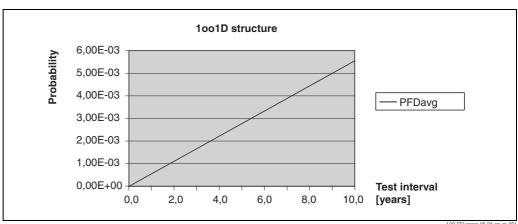

Liquiphant M/S:

- Permanent and/or heavy build-up or "non-Newtonian media"
- Solid proportions of the medium with a diameter > 5.0 mm
- Corrosion within the scope of the media compatibility with regard to fork material and coating.

Liquiphant S:

■ Hydrogen diffusion at temperatures over 180 °C and over 64 bar.

Exida Management Summary

Management summary

This report summarizes the results of the hardware assessment with proven-in-use consideration according to IEC 61508 / IEC 61511 carried out on Liquiphant M/S with relay output FEL 54 with software version V1.0 for applications with MIN detection.

The hardware assessment consists of a Failure Modes, Effects and Diagnostics Analysis (FMEDA). A FMEDA is one of the steps taken to achieve functional safety assessment of a device per IEC 61508. From the FMEDA, failure rates are determined and consequently the Safe Failure Fraction (SFF) is calculated for the device. For full assessment purposes all requirements of IEC 61508 must be considered.

The failure rates used in this analysis are based on the Siemens standard SN 29500.

mode has to be \geq 10° to < 10° for SIL 2 safety functions. A generally accepted distribution of PD_{0xo} values of a SIF over the sensor part, logic solver part, and final element part assumes that 35% of the total SIF PPD_{0xvo} value is caused by the sensor part. For a SIL 2 application the total PPD_{0xvo} value of the SIF should be smaller than 1,00E-02, hence the maximum allowable PFD_{0xvo} value for the sensor part would then be 3,50E-03. According to table 2 of IEC 61508-1 the average PFD for systems operating in low demand

Liquiphant M/S with relay output FEL 54 is considered to be a Type B1 component having a hardware fault tolerance of 0. Type B components with a SFF of 60% to < 90% must have a hardware fault tolerance of 1 according to table 3 of IEC 61508-2 for SIL 2 (8ub-) systems.

As Liquiphant M/S with relay output FEL 54 is supposed to be a proven-in-use device, an assessment of the hardware with additional proven-in-use demonstration for the device and its software was carried out. Therefore according to the equirements of IEC 615/1-1 First Edition 2003-01 section 11.4, and the assessment described in section 5.1 a hardware fault tolerance of 0 is sufficient for SIL 2 (sub-) systems being Type B components and having a SFF of 60% to

FMEDA and Proven-in-use Assessment

excellence in dependable automation

Project:

Applications with level limit detection in liquids (MIN detection) Level limit switch Liquiphant M/S with relay output FEL 54

Customer:

Endress+Hauser GmbH+Co.KG

Germany

Version V1, Revision R1.0, August 2003 Report No.: E+H 02/6-16 R017 Contract No.: E+H 02/6-16 Stephan Aschenbrenner The document was prepared using best effort. The authors make no warranty of any kind and shall not be liable in any event for incidental or consequential amanges in conscious with the application of the document. © All nghis reserved.

The functional assessment has shown that Liquiphant MIS with relay output FEL 54 has a PFD_{xvo} within the allowed range for SIL 2 according to table 2 of IEC 61508-1 and table 3-1 of ANSI/IAS-48.401--1996 and a Safe Failure Fraction (SFF) of > 73%. Based on the verification of "prior use" it can be used as a single device for SIL2 Safety Functions in terms of IEC 61511-1 First Edition 2003-01.

A user of Liquiphant M/S with relay output FEL 54 can utilize these failure rates in a probabilistic model of a safety instrumented function (SIF) to determine suitability in part for safety instrumented system (SIS) usage in a particular safety integrity level (SIL). A full table of failure rates for different operating conditions is presented in section 5.2 along with all assumptions.
